

Lab 5 (Bootstrap, Part 1)

Step 1:- Create a new folder “Lab5” inside your cist repository, next copy all the files from Lab4.

Step 2:- Create a new page contactme.html, and use anchor link to connect from the other 3 pages, please make sure all 4 pages have a link to connect other pages.

Step 3:- Now inside contactme.html page add the bootstrap CDN links and make sure that bootstrap gets loaded in the browser when you test your page locally.

Step4:- Now be creative, get all the information from a user such as a name, phone number, email, address and any message for you. For message please use the text area.

Step 5:- For all the fields have an appropriate validator, make sure if a user enters the incorrect value give the message.

Step 6:- Now once the user submits a form prompt a modal window and show a message (more instructions about this will be provided in the class).

Step 7:- Now inside Lab5 create a new HTML page, no need to link with other pages, now select 10 different unique bootstrap components which we haven't covered in the class and you haven't used in the contact page. For each component use the bootstrap grid system and add them.
