Lab -7 (BootStrap and Javascript)

1. Create a new folder Lab7 inside your CIST1300-001 folder, next copy files from Lab6.
2. Now in the Lab7 folder, add a new page called index.html, if you already have the same name, please change the existing one to quiz.html.
3. In index.html page, use Bootstrap and gather user information, such as user First, last name and Email. You can get more information you want, however, I expect you to to get the above 3 pieces of information. All the 3 fields are required, the user shouldn't be proceeding to the next page until the input is validated
4. In index.html page add alert function, where it alerts the user that their first name and displays a welcome message.
5. Remember we have used form action in the previous lab, in index page you will be using forms and action send users to the quiz.html page. You will use JavaScript to display the welcome message using Javascript alert.
6. The goal for today is getting familiar with Javascript alert function and how to read input values using javascript.
7. Sync your gitlab, push your code and complete Lab- 7 reflections on slack.
